Script Idea

My StudySync website will have an assignment task tracker on my home page that will track the progress of all your assignments. The student will enter the total number of assignments and how many they have completed. Then JavaScript will calculate the percentage of completed assignments and display it on the screen.

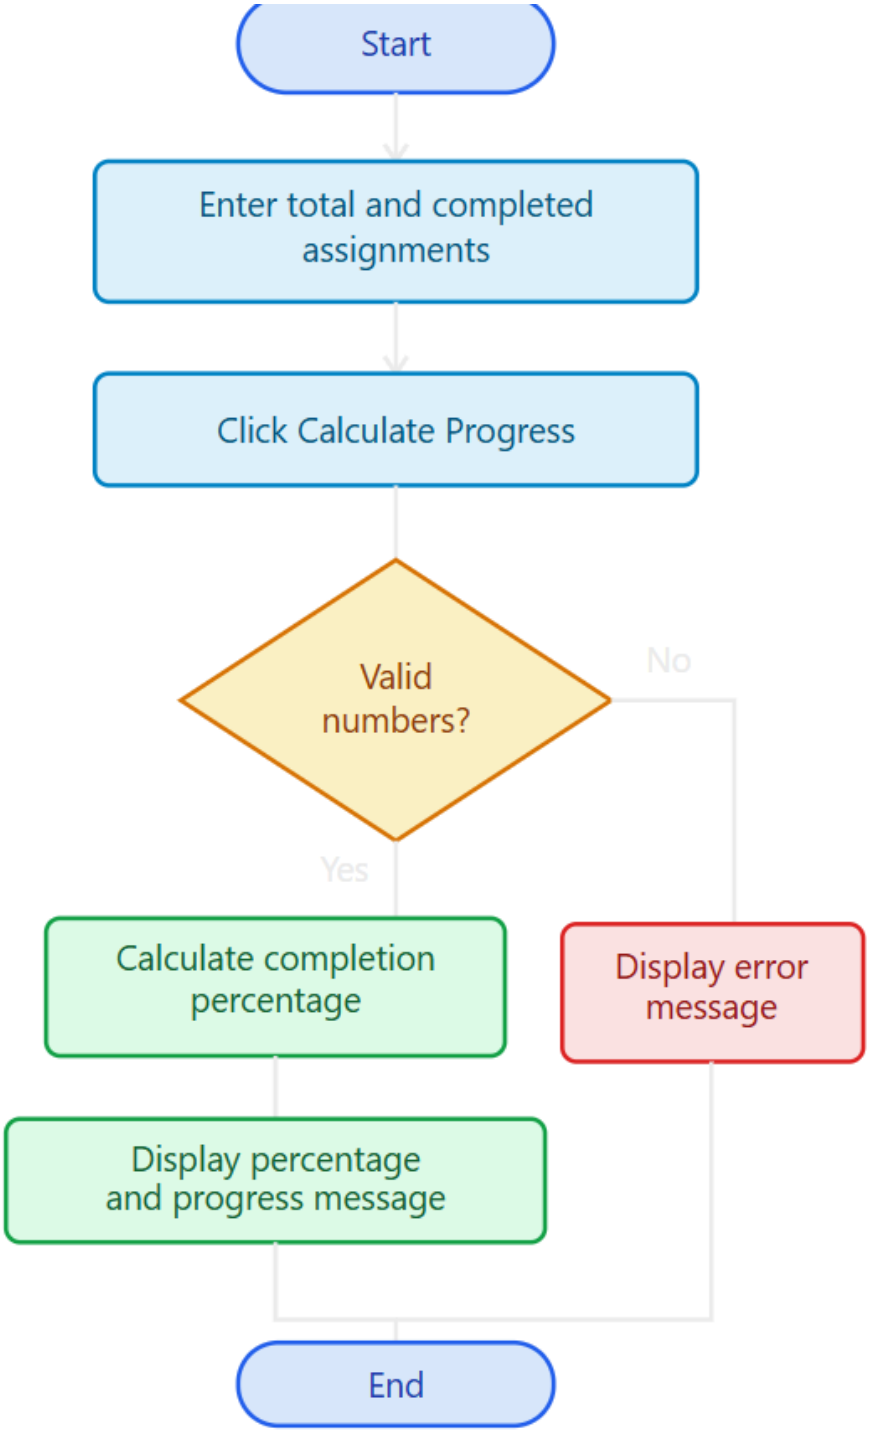

Goals

The goal of my script is to make StudySync more interactive and efficient for students by letting them enter assignment information and instantly see their completion percentage. This will be really helpful for students with many assignments, helping them track their progress.

Task Breakdown

1. Create input fields for the total number of assignments and completed assignments.
2. Add a button that students can click to calculate their progress.
3. Use JavaScript variables to store the assignment numbers and a progress message.
4. Use arithmetic operators to calculate the completion percentage.
5. Use DOM methods to select the HTML elements on the Tasks page.
6. Display the calculated percentage and a progress message on the page.

Flowchart

Start
Enter total and completed assignments
Click Calculate Progress
Valid numbers?
No
Yes
Calculate completion percentage
Display error message
Display percentage and progress message
End
